

ASBESTOS ENCAPSULATION

WHAT DOES THAT MEAN?

With the asbestos abatement regulation the cleaning of the asbestos is prohibit and therefore alternative ways must be found to make the asbestos surface safe.

This is a process where a products is applied onto the asbestos surface to encapsulate it or seal it. It is a thin layer that will be applied onto the raw or treated asbestos.

It can be applied by brush, roller but airless spray are recommended due to the fact that the products is applied with force so the bonding will be much better.

Once the product is applied and cured any finishing coat can be applied.

WHO CAN APPLY IT?

The manufacturer recommend that a approved applicator must apply the product but it can be applied as a DIY product without any warranties.

If not applied by a approved applicator we will work with you to make sure that all necessary step is followed to ensure the best end results.
